## ENERGY TRANSITION STUDIES

## INTRODUCTION

Accelerating the energy transition through research into technical, economic, social and policy aspects of the energy transition for, and in collaboration with, knowledge institutions, governments, companies and social organizations

# › HYDROGEN STORAGE OPTIONS

Hydrogen holds much promise as an energy carrier and, compared to other forms of energy storage (e.g. electricity in batteries), can be stored in large volumes for long duration. However, being the lightest molecule, the properties of hydrogen make large scale storage challenging:

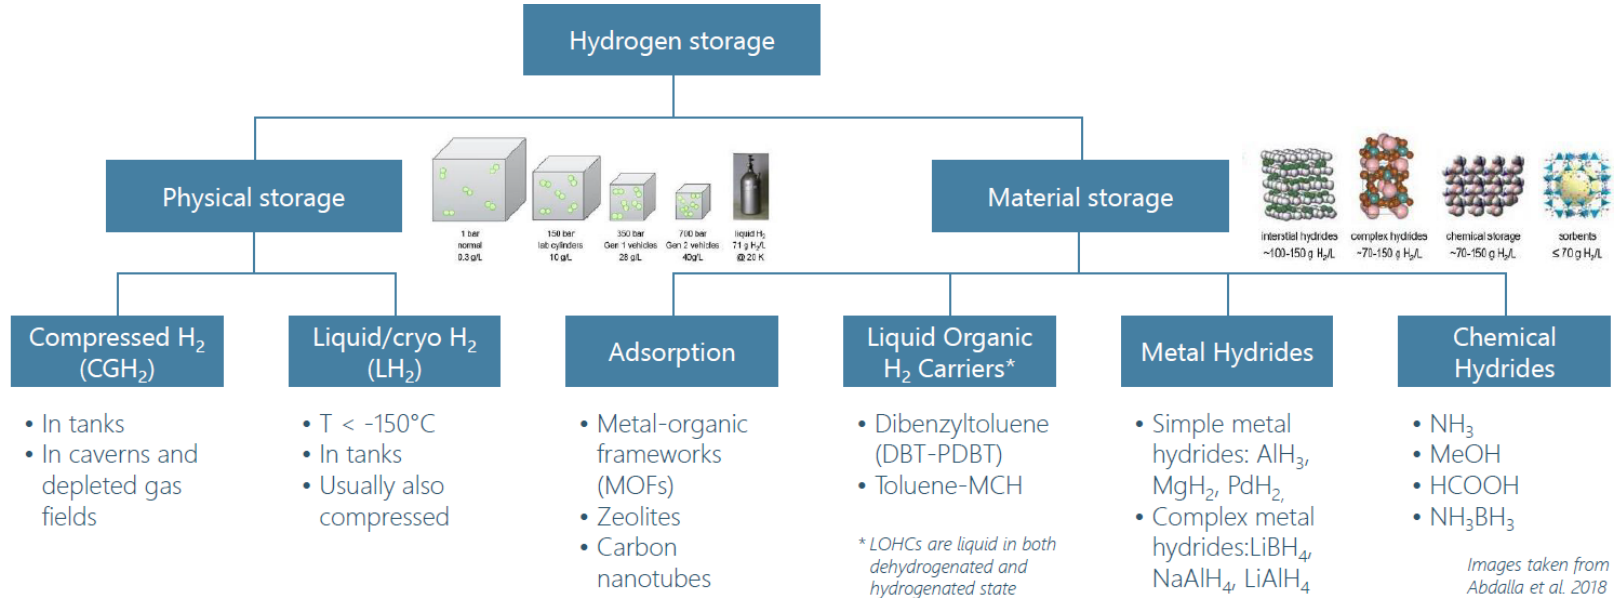

- › The volumetric energy density of hydrogen gas is low ( $10,8 \text{ MJ/m}^3$  at 1 atm), so physical storage requires compression.
  - › 1 liter gasoline  $\approx$  1 m<sup>3</sup> natural gas  $\approx$  3 m<sup>3</sup> hydrogen  $\approx$  3000 liter hydrogen
  - › Efficiency Fuel Cell Electric Vehicles  $\geq$  2x gasoline vehicles
  - › Compression to 700 bar

Example of a Type IV tank

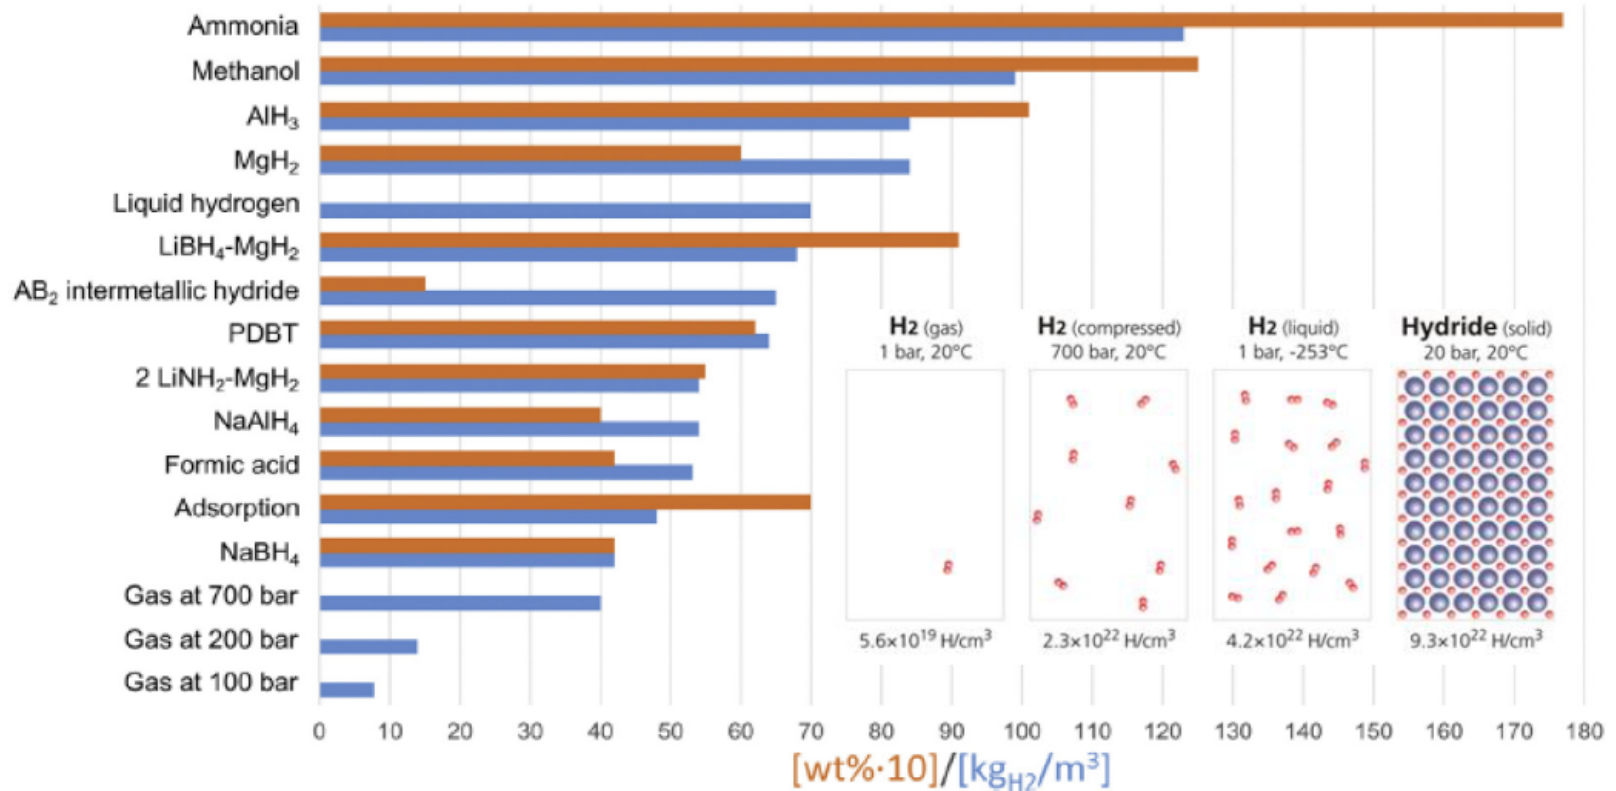

# HYDROGEN STORAGE OPTIONS

Fundamentally, there are two main approaches to H<sub>2</sub> storage: **Physical H<sub>2</sub> storage**, and **Material-based H<sub>2</sub> storage**

Storage in metal-organic frameworks (MOFs) or carbon nanotubes is technically feasible, but prohibitively expensive at this point. Similarly, concepts based on metal hydrides don't yet show commercial promise.

# HYDROGEN STORAGE OPTIONS

J. Andersson & S. Gronkvist, 2019, *Large-scale storage of hydrogen*

# TYPICAL CAPACITIES OF HYDROGEN STORAGE OPTIONS

| Unit             | Cylinder         | Tube trailer        | Liquid storage         | Salt cavern           | Gas field |
|------------------|------------------|---------------------|------------------------|-----------------------|-----------|
| Mass             | 0.9 kg           | 900 kg              | 300 ton                | 7.2 kton              | 1.4 Mton  |
| Natural Gas eqv. | 3 m <sup>3</sup> | 3400 m <sup>3</sup> | 1.1 mln m <sup>3</sup> | 27 mln m <sup>3</sup> | 5.2 bcm   |
| Cars             | -                | 7                   | 2,300                  | 55,000                | > 10 mln  |
| Houses           | -                | 2 – 3               | 850                    | 20,000                | 3,9 mln   |

Cars: 13,000 km/yr and 1 kg H<sub>2</sub>/100 km; houses: 1340 m<sup>3</sup> natural gas per year

# MANY SIZES IN COMPRESSED AND CRYOGENIC STORAGE

CGH2 storage Energiepark Mainz, 20-80 bar, 1000 kg

Cryogenic storage tanks

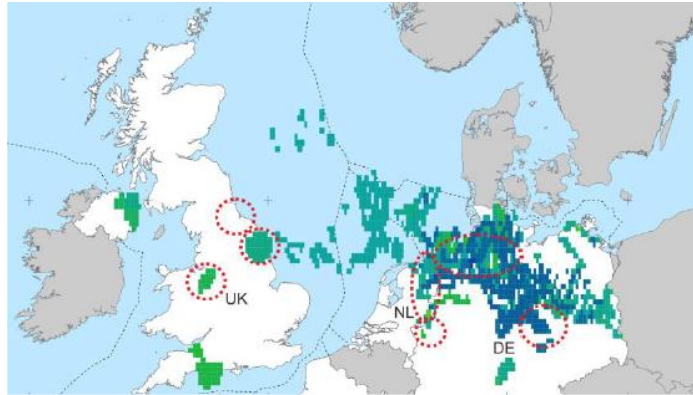

DLR, Germany: LH2 4.7 ton (2 bar) and CGH2 4.4 ton 300 bar

Spherical LH2 tank NASA. Storage up to ~300 ton

# HYDROGEN UNDERGROUND STORAGE

- › H<sub>2</sub> storage in salt caverns already operational in 4 locations (US 3x, UK) to secure supply of H<sub>2</sub> to petrochemical clusters – very low cycling frequency

Quantitative Estimation of Storage Resources for Hydrogen in Salt Caverns in the United Kingdom, the Netherlands, Germany, France, Spain and Romania.

For underlying assumptions and modelling approach see text (Deliverable 4.3). Raster has a cell size of 100 km<sup>2</sup>.

0 500km

Site selected in case study

- › To provide flexibility to future large-scale power-to-H<sub>2</sub> / H<sub>2</sub>-to-power conversion systems, and secure supply of hydrogen, higher cycling frequencies are anticipated.
- › Energystock (subsidiary Gasunie) and TNO to conduct field tests (summer 2021) under operational conditions to validate mechanical integrity and leak tightness of materials and components of a H<sub>2</sub> salt cavern storage system .

# DIFFERENT MODES OF TRANSPORT OF HYDROGEN

# DIFFERENT MODES OF TRANSPORT OF HYDROGEN

Source: <https://www.theworldofhydrogen.com/gasunie/infrastructure/>

# DIFFERENT MODES OF TRANSPORT OF HYDROGEN

Source: <https://www.theworldofhydrogen.com/gasunie/infrastructure/>

# COMPRESSED GASEOUS HYDROGEN BY TRUCK

Steel cylinder (Pallet 15 Cyld)  
200 bar – 0.8 kg (Pallet 15 kg hydrogen)

Conventional steel tubes (tube trailer)  
200 bar – 300 kg hydrogen

Composite cylinders  
up to 500 bar and >1000 kg hydrogen

## LIQUID HYDROGEN BY TRAILER AND CONTAINER

Liquid hydrogen tanker  
~ 4000 kg hydrogen

Liquid hydrogen container (40 ft)  
~ 3000 kg

# CURRENT HYDROGEN PIPELINE NETWORK

Air Products

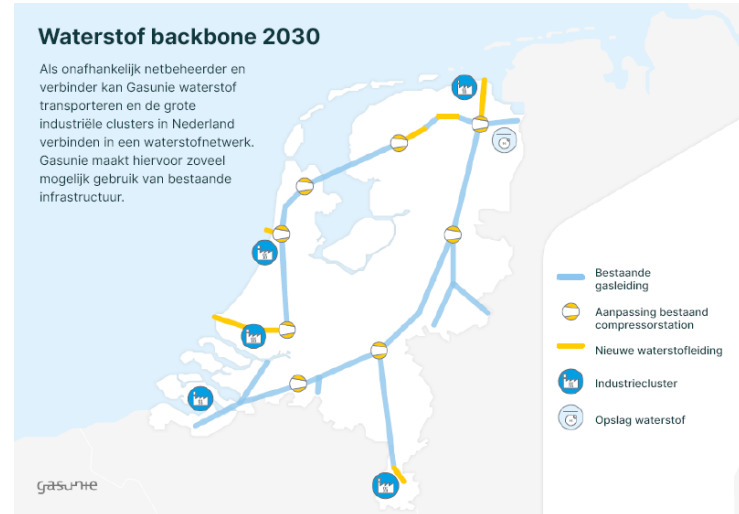

Air Liquide

# › USE/CONVERSION EXISTING GAS INFRA FOR HYDROGEN

- › An existing 12 km gas pipeline between Dow and Yara has been converted into a hydrogen pipeline by Gasunie in 2018.

- › Conversion of natural gas infra to hydrogen

- › Admixing? Legislation is lagging behind:
  - › 0.02% H<sub>2</sub> permitted in transport
  - › 0.5% H<sub>2</sub> permitted in distribution

# EUROPEAN HYDROGEN BACKBONE PLAN

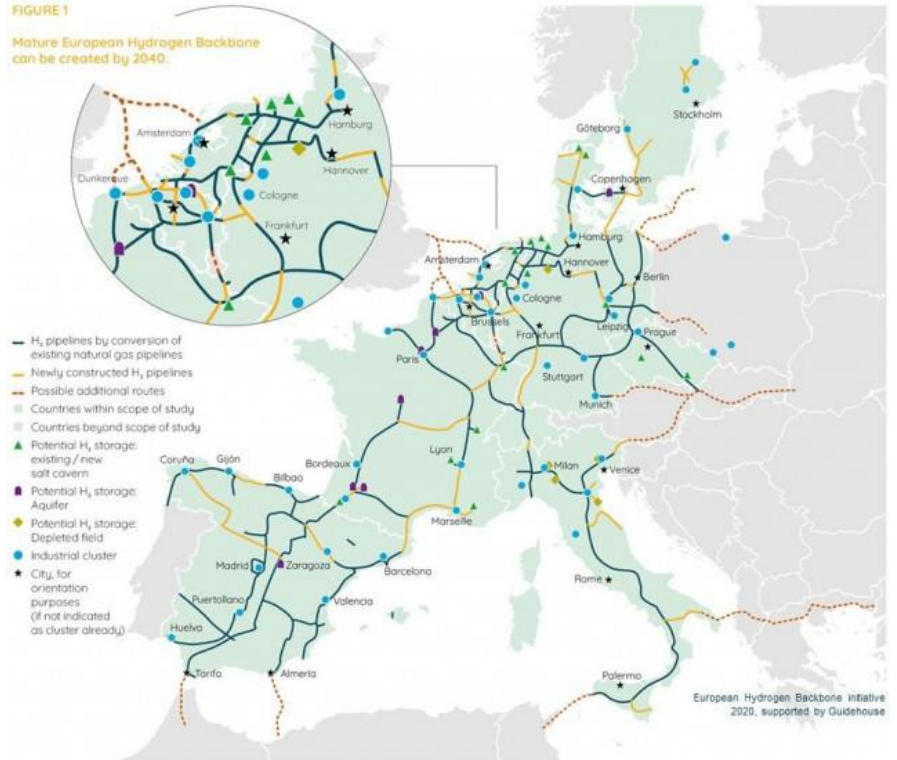

- › In the NL, Gasunie has proposed concrete plans to convert one of their natural gas networks into a backbone network for H<sub>2</sub> transport.

- › Gas infrastructure companies [published a white paper in July 2020](#) presenting their plan for a future H<sub>2</sub> backbone network

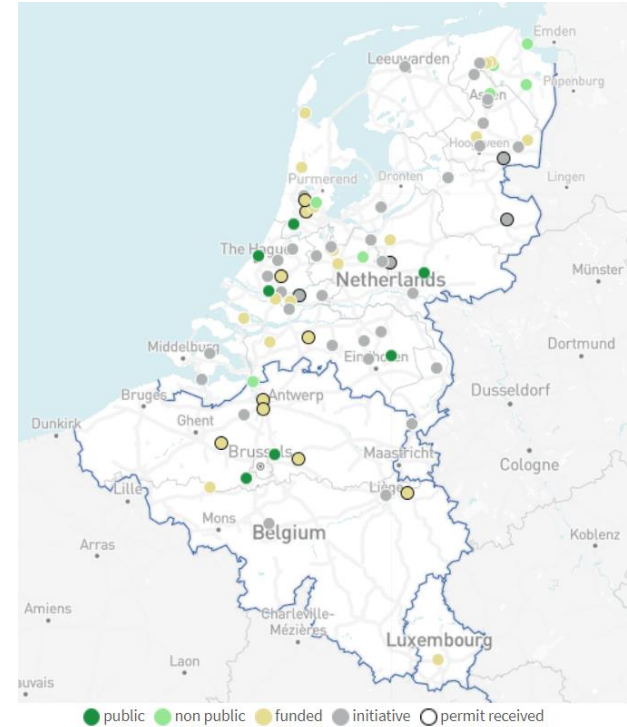

FIGURE 1

Mature European Hydrogen Backbone can be created by 2040.

# INTERCONTINENTAL TRANSPORT OF (GREEN) HYDROGEN

## Characteristics of different energy carriers for H<sub>2</sub> supply chains:

| CHARACTERISTICS   | LIQUID  | TOLUENE-MCH  | AMMONIA (NH <sub>3</sub> )  |
|-------------------|---|--|---|
| <b>Challenges</b> | <ul style="list-style-type: none"> <li>Requires very low temperature (about -250 °C)</li> <li>High energy requirement for cooling/liquefaction</li> <li>Demands cost reduction for liquefaction</li> <li>Liquefaction currently consumes about 45% of the energy brought by H<sub>2</sub></li> <li>Difficult for long-term storage</li> <li>Requires boil-off control (0.2%–0.3% d<sup>-1</sup> in truck)</li> <li>Risk of leakage</li> </ul> | <ul style="list-style-type: none"> <li>Requires high-temperature heat source for dehydrogenation (higher than 300 °C, up to 300 kilopascal)</li> <li>The heat required for dehydrogenation is about 30% of the total H<sub>2</sub> brought by MCH</li> <li>As MCH with molecular weight of 98.19 gram per mol<sup>-1</sup> only carries three molecules of H<sub>2</sub> from toluene hydrogenation, the handling infrastructure tends to be large</li> <li>Durability (number of cycles)</li> </ul> | <ul style="list-style-type: none"> <li>Lower reactivity compared to hydrocarbons</li> <li>Requires treatment due to toxicity and pungent smell</li> <li>Treatment and management by certified engineers</li> <li>Consumes very high energy input in case of dehydrogenation (about 13% of H<sub>2</sub> energy) and purification</li> </ul> |
| <b>Advantages</b> | <ul style="list-style-type: none"> <li>High purity</li> <li>Requires no dehydrogenation and purification</li> </ul>   | <ul style="list-style-type: none"> <li>Can be stored in liquid condition without cooling (minimum loss during transport)</li> <li>Existing storing infrastructure</li> <li>Existing regulations</li> <li>No loss</li> </ul>  | <ul style="list-style-type: none"> <li>Possible for direct use</li> <li>Potentially be the cheapest energy carrier</li> <li>Existing NH<sub>3</sub> infrastructure and regulation</li> </ul>  |

- › No clear winner identified at this point. Techno-economic feasibility strongly influenced by conditions on both sides of the chain
- › LH<sub>2</sub>, LOHCs and NH<sub>3</sub> appear to be the most promising options for long-distance transport (with the aim of reconversion to H<sub>2</sub>)
- › In Japan, liquid and LOHC import options are being demonstrated at industrial scale, to gain experience and be better able to compare
- › Each option has its merits, and equally each of them presents specific challenges and hurdles towards large-scale deployment

# LIQUID HYDROGEN (LH<sub>2</sub>)

- Large scale liquid H<sub>2</sub> carriers have yet to be built, but are technically possible and fundamentally similar to large LNG carriers (although the lower boiling point of H<sub>2</sub> does pose additional challenges).

Dec 2019 launch of a demo vessel

# LIQUID ORGANIC HYDROGEN CARRIERS (LOHCs)

- Typical examples are organic molecules containing aromatic rings, such as toluene, naphthalene, or dibenzyltoluene.
- When hydrogenated, these molecules contain nearly as much hydrogen per cubic meter as liquid hydrogen, without requiring the use of special materials and storage under cryogenic conditions.
- The diagram below illustrates the basic principle of a H<sub>2</sub> supply chain using this approach:

# LOHC DEMO PROJECT (BRUNEI)

- › Collaboration between four Japanese companies to establish the world's first demo scale H<sub>2</sub> import chain based on LOHCs, using Chiyoda's SPERA Hydrogen® Technology. The H<sub>2</sub> is sourced from an SMR near an LNG plant in Brunei.
- › First LOHC shipment delivered in Dec 2019, and H<sub>2</sub> was delivered from the dehydrogenation plant to a gas turbine in May.

# › OPTIONS FOR THE TRANSPORT OF (GREEN) HYDROGEN

Exhibit 15 | Global shipping of hydrogen

Cost of shipping liquid hydrogen across regions, 2030  
USD/kg

Source and expected cost level of low-carbon hydrogen in different regions

- Distribution
- Production

- › The concept of transporting green H<sub>2</sub> internationally, in various forms, has gained traction in recent years
- › Several techno-economic evaluations were carried out and published, as a first example the 2020 Hydrogen Council report *Path to hydrogen competitiveness*
- › Four cases were evaluated: Chile to US, Saudi Arabia to Germany, Saudi Arabia to Japan, and Australia to Japan
- › According to the authors, export costs could be as low as 1.7\$/kg H<sub>2</sub> in 2030. Overall delivered H<sub>2</sub> costs range from 2.7 to 3.7 \$/kg H<sub>2</sub>
